

Munoda device:

Munoda is a versatile, multi-purpose tool used to connect and deliver combination therapies for patients in need. Munoda is easy to use, and easily adapts to most systems without the need to search for proprietary adapters when speed of care is most important. No more searching for different adapters - one tool does it all. No more choosing between one therapy or another - Munoda allows concurrent respiratory treatments and increased oxygen delivery when patients need it most. Simple to use, ingenious design.

A handwritten signature in black ink, appearing to read 'SG', with a stylized flourish at the end.
