Re: Letter of Endorsement — SINODA™

To Whom It May Concern:

Managing acute hypoxic respiratory failure at the bedside routinely presents a familiar dilemma: a patient on high-concentration supplemental oxygen who also requires nebulized bronchodilator or other inhaled therapy, without compromising the oxygen delivery already in place. Historically, meeting both needs simultaneously has required improvised, ad hoc setups — cutting corrugated tubing, rigging spring-loaded valves, or swapping interfaces back and forth — solutions that are time-consuming, inconsistent, and not without risk to both patient and staff.

SINODA™ addresses this problem directly. It is a single-patient-use, disposable, latex-free adapter that allows simultaneous delivery of high-concentration oxygen and nebulized medication through one simple interface, without interrupting oxygen flow. Its compatibility across oxygen delivery systems — including non-rebreather masks, Venturi devices, and tracheostomy collars — makes it adaptable to the full range of patients I see in both the ICU and on the general pulmonary floor, and its ability to accommodate two reservoir bags simultaneously to generate a CPAP-like effect is a genuine asset in patients with more severe hypoxemia.

Beyond its clinical versatility, SINODA™'s design reduces the burden on respiratory therapy and nursing staff at the bedside. Because it eliminates the need to modify equipment or improvise workarounds, it saves valuable time during periods of high patient volume, and its single-patient-use, latex-free construction supports both infection control and patient safety, particularly for patients with latex sensitivities.

I am a triple-board certified pulmonary, internal medicine and critical care physician. I have been the chair of Cardiopulmonary Resuscitation for the last 6 years and work closely with my respiratory team both in pulmonary and intensive care capacities. I have found SINODA™ to be a simple, well-designed, and genuinely useful addition to respiratory care, and I recommend it without reservation to colleagues managing patients with hypoxic respiratory failure who require concurrent inhaled therapy.

Sincerely,
